

Django REST Framework Authentication Assignment

1. BasicAuthentication - Playlists API

```
Create a protected endpoint: /api/playlists/

authentication_classes = [BasicAuthentication]
permission_classes = [IsAuthenticated]

Only authenticated users can view playlists.
```

2. TokenAuthentication - Orders API

```
Create endpoint: /api/orders/

authentication_classes = [TokenAuthentication]
permission_classes = [IsAuthenticated]

Generate token using:

from rest_framework.authtoken.models import Token

Test:
- Without token → 401 Unauthorized
- With token → Access granted
```

3. SessionAuthentication - Cart API

```
Create endpoint: /api/cart/

authentication_classes = [SessionAuthentication]
permission_classes = [IsAuthenticated]

Only logged-in users can add items to cart.

Unauthenticated users receive:
403 Forbidden
```

4. Custom Permission - IsPremiumUser

```
Create custom permission:

class IsPremiumUser(BasePermission):
    def has_permission(self, request, view):
        return (
            request.user.is_authenticated and
            hasattr(request.user, 'is_premium') and
            request.user.is_premium
        )

Apply to:
/api/tickets/

Only premium users can access tickets API.
```

5. TokenAuthentication vs SessionAuthentication

TokenAuthentication and SessionAuthentication are both authentication methods in Django REST Framework,

SessionAuthentication is mainly used for web applications where users log in through a browser. Django s

TokenAuthentication is mainly used for APIs and mobile applications. The client sends a token in the Aut

Key Differences:

- SessionAuthentication uses cookies and sessions.
- TokenAuthentication uses tokens.
- SessionAuthentication is best for websites.
- TokenAuthentication is best for REST APIs and mobile apps.
